IVERMECTIN SOLUTION ITEM #0555

Many of our customers throughout the world have requested us to provide them with individual doses of Ivermectin to make a gallon of treated water. For all those who don't want to go through the trouble of buying a large quantity of Ivermectin Solution, we at Abba have prepared a dosage that you simply add to a gallon of your own water as instructed below.

Put the contents of this bottle in 1 gallon of drinking water and follow the instructions below very carefully.

In the evening, just before the birds go to sleep, remove all the drinking water from the cages or aviary. The next morning the birds will be nice and thirsty. Vigorously shake the gallon after you added the Ivermectin. Shake the mixture well while administering it to the birds. Make sure you use a clean, sterilized water container. The birds will drink the solution with gusto. Usually one good drink will help eliminate internal and external parasites, including scaly feet and scaly legs. Leave the water treated with Ivermectin before the birds until they drink all of it or until the next day. Repeat the treatment in two weeks (14 days.).

Many bird fanciers throughout the world treat all their birds with the above-mentioned method twice a year--in January and again at the end of the breeding season.

Be careful, Ivermectin is a very powerful parasiticide. An overdose may kill your birds. Do not administer Ivermectin straight from the bottle.

It is very difficult to properly administer Ivermectin by placing one drop in the beak as many suggested. Can you imagine treating 300-400 birds, one at a time?

The above method is the best way to cure infestation of external parasites, such as scaly legs, scaly faces, perhaps some intestinal worms and tracheal mite?

Make sure to refrigerate any remaining mixture. It can be used again in 14 days.

If ordered with other items no additional shipping charge; otherwise 1Lb for shipping.
